

Umer Siddiqui

AI/ML Engineer || Python Developer

I'm a skilled AI/ML Engineer and Python Developer with expertise in Deep Learning, Computer Vision, and Data Analysis. My portfolio includes impactful projects like real-time violence detection using YOLO, a patient face recognition system leveraging Flask and DeepFace, and gesture-controlled games using CNNs and Pygame. I specialize in Generative AI (GenAI) and Large Language Models (LLMs), developing RAG systems, and bespoke AI agents.

EDUCATION

Engineering Program

NED University of Engineering and Technology

02/2022 - 02/2026

Grade :B+

Department:

- [Electrical Engineering](#)

F.sc (Pre-Engineering)

Bahria College Karsaz

2020 - 2022

Grades

- Completed High School / College from BIEK with 996/1100 marks

Secondary School (10th)

CAA Model School and College • Karachi

2019 - 2020

Grades

- Completed 10th from BSEK with 755/850 marks

INTERNSHIP

AI Intern

NCL NEDUET

04/2024 - 10/2024

Task

- I interned at NCL, where I contributed to AI and EDA projects. During my time there, I applied my expertise in data exploration, AI model development, and optimization to deliver impactful solutions to real-world challenges.

Jr AI Developer

Erly Stage Studios

10/2024 - Present

Task

- As a Jr. AI Developer at Erly Stage Studios, I spearheaded the AI components of various projects, leveraging Generative AI (GenAI) and LLMs. My contributions included developing RAG systems, agentic RAGs, and bespoke AI agents tailored to specialized use cases, delivering innovative solutions that enhanced project efficiency and effectiveness.

SKILLS

Deep Learning

Machine Learning

Data Analysis

Computer Vision

Advance Python Development

Django

Flask

SQL & NoSQL

GenAI

LLMs

RAGS

Agents

LangChain

LangGraph

PERSONAL PROJECTS

Patient Face Recognition System:-Deep Learning || Computer Vision || Face Recognition || Flask || SQL || RAGS

- Patients register by submitting a form and face image. DeepFace (VGG-Face) creates face embeddings, stored with patient info in SQLite. For detection, live video embeddings are matched with stored ones, displaying details if matched. Flask handles the web interface and database operations. Additionally, I've used Rags to create a bot that interacts with people and helps them book appointments.

Violence Detector :- Deep Learning || Computer Vision || Object Detection || Yolo V8 || Flask

- This project is a Flask-based web application for real-time violence detection in uploaded video files. It utilizes a retrained YOLOv8 model to detect violent activities and annotate video frames. Users can upload videos through a web interface, which are then processed and streamed with violence detection alerts. The application supports real-time processing, displaying annotated video frames.

AI Space Invaders :- Deep Learning || Computer Vision || Python Programming || Pygame || Django

- In this project, I automated a game I developed during my second semester by fine tuning pretrained CNN model to detect hand postures, enabling gesture-based control for gameplay.

AI Virtual Paint:-Computer Vision || Object Detection || Mediapipe || Django

- An interactive application using Mediapipe for hand tracking and OpenCV for image processing, allowing users to paint on a virtual canvas with hand gestures. Features include drawing, erasing, and color changing. Built with Django for the backend.

BLDC Fan Data Analysis:- Exploratory Data Analysis || Machine Learning || Flask

- This project demonstrates the analysis of BLDC (Brushless Direct Current) fan data using an Artificial Neural Network (ANN) model to predict the speed of the fan based on various environmental factors. The project is deployed on Flask and includes a trained ANN that is used to make predictions on real-time data.

SPACE SHOOTER GAME:- Python Programming || Pygame

- I created this game using pygame and its function that takes input from keyboard,up ,down ,left ,right and shoot and acts accordingly.
