

Umer Siddiqui

AI/ML Developer

I'm a skilled AI/ML Engineer and Python Developer with expertise in Deep Learning, Computer Vision, and Data Analysis. My portfolio includes impactful projects like real-time violence detection using YOLO, a patient face recognition system leveraging Flask and DeepFace, and gesture-controlled games using CNNs and Pygame. I specialize in Generative AI (GenAI) and Large Language Models (LLMs), developing RAG systems, and bespoke AI agents.

EDUCATION

Engineering Program

NED University of Engineering and Technology

02/2022 - 02/2026

Department:

- [Electrical Engineering](#)

F.sc (Pre-Engineering)

Bahria College Karsaz

2020 - 2022

Grades

- Completed High School / College from BIEK with 996/1100 marks

Secondary School (10th)

CAA Model School and College • Karachi

2019 - 2020

Grades

- Completed 10th from BSEK with 755/850 marks

INTERNSHIP AND JOB

AI and Data Analytics Intern

NCL NEDUET

04/2024 - 10/2024

Role:

- I interned at NCL, where I contributed to AI and EDA projects. During my time there, I applied my expertise in data exploration, AI model development, and optimization to deliver impactful solutions to real-world challenges.

Jr AI Developer

Erly Stage Studios

10/2024 - Present

Part Time Job

Role:

- As a Jr. AI Developer at Erly Stage Studios, I led AI efforts using GenAI and LLMs, building RAG systems, agentic RAGs, and custom AI agents for specialized use cases to boost project impact and efficiency.

SKILLS

Deep Learning

Machine Learning

Data Analysis

Computer Vision

Advance Python Development

Django

Flask

SQL & NoSQL

GenAI

LLMs

RAGS

Agents

LangChain

LangGraph

PROJECTS

Enterprise Projects

Meeting Scheduling Agent:- LLMs || Rags || Agents

- Developed an intelligent Meeting Scheduling Agent for WhatsApp. Used OpenAI API, LangGraph, and prompt engineering to build a context-aware flow. Deployed on GCP with Firestore for real-time updates, enabling seamless natural language meeting management.

Personal Projects

Patient Face Recognition System:-Deep Learning || Computer Vision || Face Recognition || Flask || SQL || RAGS

- Patients register via a form with a face image. DeepFace (VGG-Face) generates embeddings stored in SQLite with patient info. During detection, live video embeddings are matched to show details if recognized. Flask powers the web interface and database. A RAG-based bot assists users with booking appointments.

Violence Detector :- Deep Learning || Computer Vision || Object Detection || Yolo V8 || Flask

- A Flask web app for real-time violence detection in uploaded videos using a retrained YOLOv8 model. Users upload videos via a web interface, and the app streams annotated frames with violence alerts in real time.

AI Space Invaders :- Deep Learning || Computer Vision || Python Programming || Pygame || Django

- In this project, I automated a game I developed during my second semester by fine tuning pretrained CNN model to detect hand postures, enabling gesture-based control for gameplay.

AI Virtual Paint:-Computer Vision || Object Detection || Mediapipe || Django

- An interactive application using Mediapipe for hand tracking and OpenCV for image processing, allowing users to paint on a virtual canvas with hand gestures. Features include drawing, erasing, and color changing. Built with Django for the backend.

BLDC Fan Data Analysis:- Exploratory Data Analysis || Machine Learning || Flask

- This project analyzes BLDC fan data using an ANN model to predict fan speed based on environmental factors. It's deployed on Flask with real-time prediction capabilities.
